

## ASPNETCore WebAPI-ADO.NET STORE PROCEDURE

### CRUD(read,create,update,delete)

Açıklama:

#### VERİ TABANI

```
CREATE DATABASE ProductDB; db oluşturma
```

```
GO
```

```
-- Veritabanı kullanımı
```

```
USE ProductDB;
```

```
GO
```

```
-- Products tablosu oluşturma
```

```
CREATE TABLE Products (
```

```
    ProductId INT PRIMARY KEY IDENTITY(1,1),
```

```
    Name NVARCHAR(100) NOT NULL,
```

```
    Price DECIMAL(18,2) NOT NULL,
```

```
    Description NVARCHAR(MAX)
```

```
);
```

#### STORE PROCEDURES

##### sp\_GetProducts

```
CREATE PROCEDURE dbo.GetProducts
```

```
AS
```

```
BEGIN
```

```
SELECT * FROM Products;
```

```
END
```

##### sp\_GetProductById

```
CREATE PROCEDURE dbo.GetProductById
```

Bu yazımda C# ya da ASP.net ile veritabanı işlemlerinde Stored Procedure kullanmayı göstereceğim. Bütün select, insert, delete ve update işlemlerini gerçekleştirirken stored procedure kullanmak en faydalı yöntemdir. Bunun sebebi hem güvenlidir hemde Execute sistemini bir kere çalıştırıp bir daha kasmamasıdır.

@ProductId INT

AS

BEGIN

SELECT \* FROM Products WHERE ProductId = @ProductId; *bu id ye göre GET i leni yapar.*

END

### **sp\_InsertProduct**

CREATE PROCEDURE dbo.InsertProduct

@Name NVARCHAR(100),

@Price DECIMAL(18, 2),

@Description NVARCHAR(MAX)

AS

BEGIN

INSERT INTO Products (Name, Price, Description)

VALUES (@Name, @Price, @Description); *yeni de er ataması yapar.*

END

### **sp\_UpdateProduct**

CREATE PROCEDURE dbo.UpdateProduct

@ProductId INT,

@Name NVARCHAR(100),

@Price DECIMAL(18, 2),

@Description NVARCHAR(MAX)

AS

BEGIN

### **UPDATE Products**

SET Name = @Name, Price = @Price, Description = @Description *property leri set etme de i time, güncelleme*

```

WHERE ProductId = @ProductId;

END

sp_DeleteProduct

CREATE PROCEDURE dbo.DeleteProduct

    @ProductId INT

AS

BEGIN

    DELETE FROM Products WHERE ProductId = @ProductId; bu id ye göre silme i lemi yap

END

```

## ADONET CRUD İŞLEMLER

```

// ProductsController.cs

using Microsoft.AspNetCore.Mvc;

using System;

using System.Collections.Generic; Generic paketi L ST den gelir.

using System.Data; => Kullanılan ado.net paketleri
using System.Data.SqlClient;

namespace YourNamespace.Controllers
{
    [Route("api/[controller]")]
    [ApiController]

    public class ProductsController : ControllerBase
    {
        //db bağlantısı start

        private readonly string _connectionString;

        public ProductsController(IConfiguration configuration)

```

```
{
    // appSettings.json'daki bağlantı adresinin adı
    _connectionString = configuration.GetConnectionString("DefaultConnection");
} //db bağlantısı end
```

### [HttpGet]

// list,SqlCommand,CommandType,StoreProcedure,ExecuteReader,while

```
public IActionResult GetProducts()
{
    // Product listesini al
    var products = new List<Product>();

    using (var connection = new SqlConnection(_connectionString))
    {
        // StoreProcedure
        var command = new SqlCommand("sp_GetProducts", connection); // bağlantı

        command.CommandType = CommandType.StoredProcedure;

        connection.Open(); // bağlantıyı aç

        using (var reader = command.ExecuteReader())
        {
            while (reader.Read()) // verileri oku (Read)
            {
                var product = new Product
                {
                    ProductId = Convert.ToInt32(reader["ProductId"]), // integer olarak oku
                    Name = reader["Name"].ToString(), // string olarak oku
                    Price = Convert.ToDecimal(reader["Price"]),
                    Description = reader["Description"].ToString()
                };

                products.Add(product); // okuduktan sonra ekle, getir
            }
        }
    }
}
```

```

    }
}
}

return Ok(products); ekledi in, getirdi in product ları dön
}

```

**[HttpGet("{id}")]**

*//SqlCommand, CommandType, StoreProcedure, ExecuteReader, Parameters.*

*AddWithValue, while*

```

public IActionResult GetProductById(int id)
{
    using (var connection = new SqlConnection(_connectionString))
    {
        StoreProcedure ba lantı
        var command = new SqlCommand("sp_GetProductById", connection);

        command.CommandType = CommandType.StoredProcedure;

        command.Parameters.AddWithValue("@ProductId", id);

        connection.Open();

        using (var reader = command.ExecuteReader())
        {
            if (reader.Read()) verileri oku(Read)
            {
                var product = new Product
                {
                    ProductId = Convert.ToInt32(reader["ProductId"]),
                    Name = reader["Name"].ToString(),
                    Price = Convert.ToDecimal(reader["Price"]),

```

```

        Description = reader["Description"].ToString()

    };

    return Ok(product);

}

else

{

    return NotFound(); bu id de bir product yoksa NotFound/404 döner.

}

}

}

}

```

### [HttpPost]

//SqlCommand, CommandType, StoreProcedure, ExecuteReader, Parameters.

AddWithValue, ExecuteNonQuery, while

```

public IActionResult InsertProduct(Product product)
{
    using (var connection = new SqlConnection(_connectionString))
    {
        StoreProcedure
        var command = new SqlCommand("sp_InsertProduct", connection); ba lantı

        command.CommandType = CommandType.StoredProcedure;

        command.Parameters.AddWithValue("@Name", product.Name);

        command.Parameters.AddWithValue("@Price", product.Price);

        command.Parameters.AddWithValue("@Description", product.Description);

        connection.Open();

        command.ExecuteNonQuery(); Ba lantı üzerinde bir Transact-SQL deyimi yürütür ve etkilenen satır
        sayısını döndürür.
    }
}

```

```
        return Ok();  
    }  
}
```

**[HttpPut("{id}")]**

//SqlCommand,CommandType,StoreProcedure,Parameters.

AddWithValue,ExecuteNonQuery,while

```
public IActionResult UpdateProduct(int id, Product product)  
{  
    using (var connection = new SqlConnection(_connectionString))  
    {  
        StoreProcedure  
        var command = new SqlCommand("sp_UpdateProduct", connection);  
        command.CommandType = CommandType.StoredProcedure;  
        command.Parameters.AddWithValue("@ProductId", id);  
        command.Parameters.AddWithValue("@Name", product.Name);  
        command.Parameters.AddWithValue("@Price", product.Price);  
        command.Parameters.AddWithValue("@Description", product.Description);  
        connection.Open();  
        command.ExecuteNonQuery(); Ba lantı üzerinde bir Transact-SQL deyimi yürütür ve etkilenen satır sayısını döndürür.  
        return Ok();  
    }  
}
```

**[HttpDelete("{id}")]**

//SqlCommand,CommandType,StoreProcedure,Parameters.

AddWithValue,ExecuteNonQuery,while

```
public IActionResult DeleteProduct(int id)
```

```
{  
    using (var connection = new SqlConnection(_connectionString))  
    {  
        StoreProcedure  
        var command = new SqlCommand("sp_DeleteProduct", connection);  
  
        command.CommandType = CommandType.StoredProcedure;  
  
        command.Parameters.AddWithValue("@ProductId", id);  
  
        connection.Open();  
  
        command.ExecuteNonQuery(); Ba lantı üzerinde bir Transact-SQL deyimi yürütür ve etkilenen satır  
sayısını döndürür.  
  
        return Ok();  
    }  
}  
  
}
```
